

Updating the logo to Qeagle

Adding one more LLM

Updating to Implement PLayerwright with Type script

The screenshot shows a web browser window with the Testleaf website (leaflaps.com/opentaps/control/main) open. The website has a login form with fields for Username and Password, and a Login button. An AI Browser Extension for Code Generation is installed and its settings panel is open. The settings include:

- Code Generator: Settings
- Supported Language: TypeScript
- Browser Engine: Playwright
- Select LLM Provider: Groq
- Select Model: openai/gpt-oss-120b
- Groq API Key: [Redacted]

The browser's taskbar at the bottom shows various application icons and the system clock indicating 10:58 on 19-07-2026.

The screenshot shows the same Testleaf website with the AI Browser Extension for Code Generation chat interface open. The chat interface displays the following TypeScript code:

```
import { Page, Locator } from '@playwright';

export class LoginPage {
  readonly page: Page;
  readonly usernameInput: Locator;
  readonly passwordInput: Locator;
  readonly submitButton: Locator;
  readonly loginForm: Locator;

  constructor(page: Page) {
    this.page = page;
  }
}
```

Below the code, there is a text input field labeled "Provide additional information". The chat interface also includes a "Reset Chat" button and a "Copy" button for the code.
